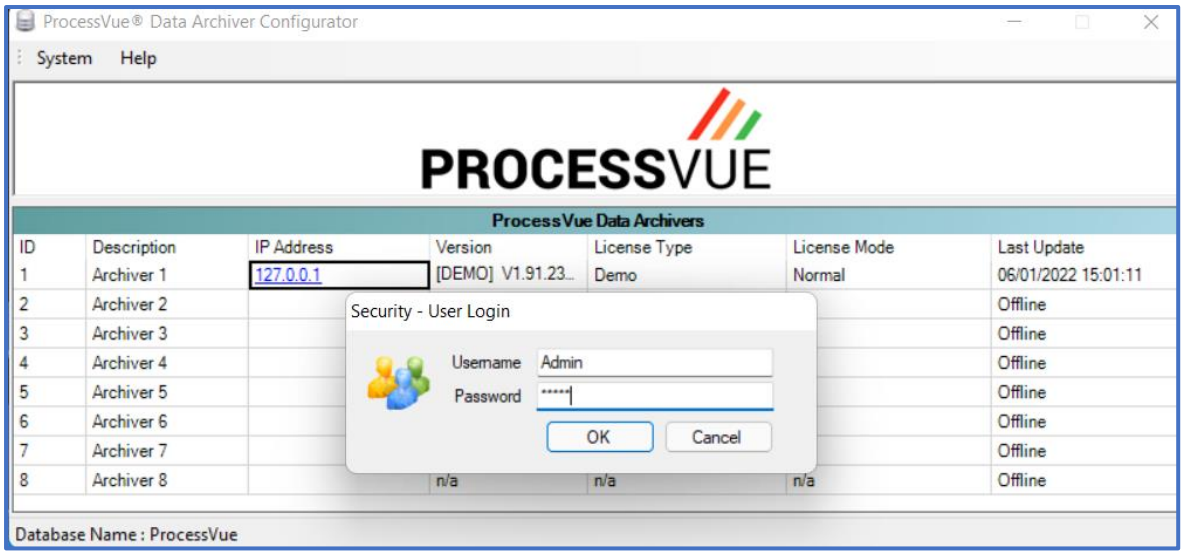
Frequency Analysis

Abstract

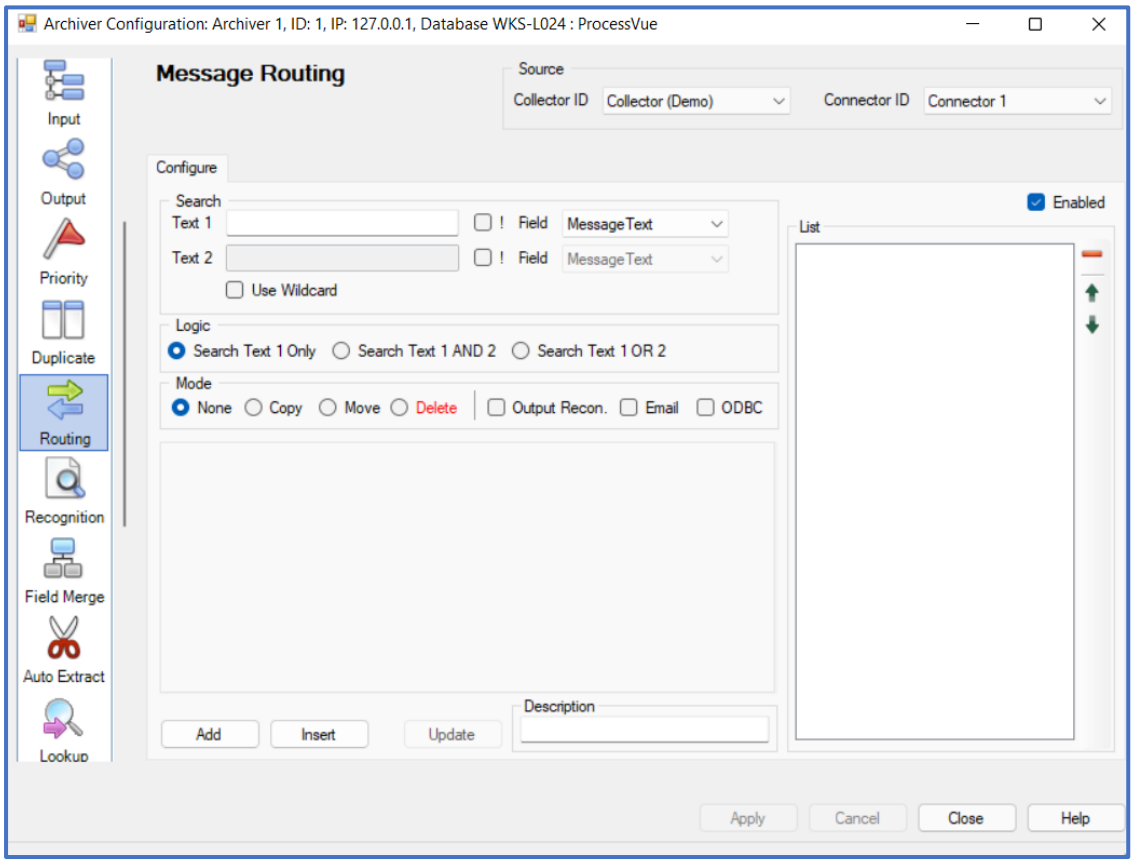
Frequency Analysis runs on a single window, how do I run it on the entire system?

It is possible to perform Frequency Analysis on the whole system. All that is needed is a small configuration to be carried out. Using the routing functionality, create a series of rules to copy messages from each of your existing connectors to a dedicated connector.
You can then run the Frequency Analysis on this combined connector.

1. Open the ProcessVue Data Archiver Configurator
2. Login using the account details:
    a. Username: Admin
    b. Password: admin



3. Select the Routing tab from the menu on the left-hand side.



4. You will then need to carry out the following:
    a. Select your Collector ID
    b. Select your Connector which is configured to receive data
    c. Select the Text to search, whether a specific tag, plant, or operator
    d. Select the Mode:
        i. Copy or Move Connectors
    e. Select the Connector to copy/move the data to
    f. Click Add
    g. Click Apply
    h. Repeat for all of your configured connectors to copy to your new dedicated connector.

NOTE: If you do not have enough Connectors on your system to carry out this task, please contact your ProcessVue representative.
